10 BACKGROUND OF THE INVENTION

Field of the Invention

The present invention relates generally to a grip member for use with stent delivery systems and to systems employing one or more of such grips.

15 Description of Related Art

The use of stents, and other implantable medical devices such as grafts, stent-grafts, vena cava filters, etc, hereinafter referred to cumulatively as stents, to maintain the patency of bodily lumens is well known.

20 Stents are typically delivered via a catheter in an unexpanded configuration to a desired bodily location. Once at the desired bodily location, the stent is expanded and implanted in the bodily lumen.

Typically, a stent will have an unexpanded (closed) diameter for placement and an expanded (opened) diameter after placement in the vessel or the duct.

25 Some stents are self-expanding; some stents are expanded mechanically with radial outward force from within the stent, as by inflation of a balloon; and some stents, known as hybrid stents, have one or more characteristics common to both self-expanding and mechanically expandable stents.

30 An example of a mechanically expandable stent and associated delivery system is shown in U.S. Patent No. 4,733,665 to Palmaz, which issued March 29, 1988, and discloses a number of stent configurations for implantation with the aid of a catheter. The catheter includes an arrangement wherein a balloon inside the stent is

inflated to expand the stent by plastically deforming it, after positioning it within a blood vessel.

A type of self-expanding stent is described in U.S. Patent No. 4,503,569 to Dotter which issued March 12, 1985, and discloses a shape memory stent which
5 expands to an implanted configuration with a change in temperature. Self-expanding stents are constructed from a wide variety of materials including nitinol, spring steel, shape-memory polymers, etc.

In many stent delivery systems, particularly those used to deliver a self-expanding stent, the stent is typically retained on the catheter via a retention device such
10 as a sheath. The stent may be deployed by retracting the sheath from over the stent. However it is known that in many cases when a sheath is withdrawn from a stent, particularly a self-expanding stent constructed of shape memory material, the individual struts or stent members of the stent will push outward as they expand back to their “remembered” shape. Often times, but undesirably, as the sheath is withdrawn from
15 about the stent, the stent will tend to migrate longitudinally relative to the stent mounting region of the catheter. This migration is believed to be caused by a longitudinal component of the force that the stent delivery system exerts on the stent during withdrawal of the sheath. The tendency of the stent to migrate during sheath retraction may result in the imprecise delivery of the stent and/or distortion of the stent
20 body.

It would thus be desirable to reduce the longitudinal component of the delivery system to stent force and/or provide a device for use in a stent delivery system that reduces or prevents stent migration during withdrawal of the stent retaining sheath.

All US patents and applications and all other published documents
25 mentioned anywhere in this application are incorporated herein by reference in their entirety.

Without limiting the scope of the invention a brief summary of some of the claimed embodiments of the invention is set forth below. Additional details of the summarized embodiments of the invention and/or additional embodiments of the
30 invention may be found in the Detailed Description of the Invention below.

A brief abstract of the technical disclosure in the specification is provided as well only for the purposes of complying with 37 C.F.R. 1.72. The abstract

is not intended to be used for interpreting the scope of the claims.

BRIEF SUMMARY OF THE INVENTION

This invention may be embodied in a variety of forms. For example, in
5 at least one embodiment, the invention is directed to a stent delivery system that reduces
or eliminates the longitudinal component of the system to stent force, which may
influence or cause migration of the stent or one or more components thereof relative to
the catheter during withdrawal of the retaining sheath. In some embodiments the
reduction in the longitudinal component of the system to stent force is accomplished by
10 reducing or minimizing the potential space between the inner catheter shaft or member,
upon which the stent is mounted prior to delivery, and the retractable outer sheath which
overlays the stent prior to delivery.

In some embodiments the potential space between the sheath and inner
member/stent is reduced by providing a stent delivery system with one or more stent
15 grips or grip members which underlie at least a portion of a stent prior to delivery. A
stent grip comprises an annular ring mounted to the catheter shaft. In some
embodiments the stent grip has an end portion and a body portion, in the reduced or pre-
delivery state the stent is disposed about the body portion and an end of the stent abuts
the end portion of the stent grip.

20 In at least one embodiment the stent grip comprises a body portion
having a tapered or varying diameter. In at least one embodiment the diameter of the
body tapers from a first diameter at a first end of the body to a second smaller diameter
at a second end of the body. In some embodiment a stent delivery system includes a
single tapered grip or a pair of tapered grips wherein each grip is respectively positioned
25 on the catheter shaft to underlie an end of the stent.

In at least one embodiment a stent delivery system comprises a single
stent grip, wherein the single grip has a body which has a length substantially the same
as that of the stent. In some embodiments, multiple grips have body portions that have a
combined length that is substantially less than or equal to that of the stent.

In some embodiments the invention is directed to a stent grip member for use in a stent delivery system wherein the stent grip is at least partially constructed of a polymer material. In some embodiments the material is preferably of a fairly soft durometer value to allow a stent to be effectively gripped or at least partially imbedded within the material of the grip.

In some embodiments a grip is insert molded, molded and then bonded to the catheter shaft, or otherwise formed separately or in conjunction with the catheter shaft or portion thereof.

These and other embodiments which characterize the invention are pointed out with particularity in the claims annexed hereto and forming a part hereof. However, for a better understanding of the invention, its advantages and objectives obtained by its use, reference should be made to the drawings which form a further part hereof and the accompanying descriptive matter, in which there is illustrated and described a embodiments of the invention.

15

BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWING(S)

A detailed description of the invention is hereafter described with specific reference being made to the drawings.

FIG. 1 is a perspective view of an embodiment of the invention.
FIG. 2 is a cross-sectional side view of an embodiment of the invention.
FIG. 3 is a cross-sectional side view of an embodiment of the invention.
FIG. 4 is a cross-sectional side view of an embodiment of the invention.
FIG. 5 is a cross-sectional side view of an embodiment of the invention.
FIGS. 6 and 7 are close up cross-sectional side views of an embodiment of the invention shown during a stent delivery process.

DETAILED DESCRIPTION OF THE INVENTION

While this invention may be embodied in many different forms, there are described in detail herein specific preferred embodiments of the invention. This description is an exemplification of the principles of the invention and is not intended to limit the invention to the particular embodiments illustrated.

For the purposes of this disclosure, like reference numerals in the figures shall refer to like features unless otherwise indicated.

As mentioned above the present invention is embodied in a variety of forms. For example, in the embodiment shown in FIG. 1 the invention is embodied in a stent retaining member or grip, indicated generally at 10, which has an outer diameter that tapers from a first, larger diameter at a first end 12 of the grip 10 to a second, smaller diameter at a second end 14 of the grip.

In some embodiments, an example of which is shown in FIG. 2, the grip 10 includes a hub or dam 16 adjacent to the first end 12. At least a portion of the hub 16 has a diameter larger than the diameter of the grip body 18. In at least one embodiment such as is shown in FIG. 3 the a stent 20 or other implantable medical device may be positioned adjacent to or butted up against an inner surface 22 of the hub 16 when the stent is disposed about the grip body 18 prior to expansion of the stent.

As is illustrated in FIG. 4, in some embodiments, a stent delivery catheter, indicated generally at 100, comprises one or more grips 10. One or more grips 10 are engaged or incorporated onto the inner shaft or member 30 of the catheter 100. The position of the grips 10 on the inner member 30 substantially correspond to the area of the member which defines a stent mounting region 32. A stent 20 is disposed about the stent mounting region 32 and in the reduced or pre-delivery state is engaged to at least a portion of each grip 10.

Where a single grip 10 is utilized, such as is shown in FIG. 5 the body 18 of the grip underlies at least a portion of the stent. In at least one embodiment, the body 18 of the grip 10 has a length which is at least as long as that of the stent 20.

Where multiple grips are used such as in FIG. 4, the lengths of each grip body 18 are approximately half the length of the stent 20 or less. In at least one embodiment the diameter of the grips taper from a larger diameter at the ends 34 of the stent 20 to a smaller diameter under the body 36 of the stent 20.

In some embodiments of the invention stent 20 is a self-expandable device such as are known. Stent 20 may be at least partially constructed from nickel, titanium, stainless steel, other metals and alloys thereof, such as nitinol. Other materials suitable for use in constructing stent 20 may include shape memory polymers, etc.

In the various embodiments of the invention, the grip 10 effectively reduces the longitudinal aspect of the catheter to stent force by ensuring that the individual struts 40 of the stent 20 are at a shallower or smaller angle upon exiting the confines of a sheath, sleeve or other stent retaining device 42 when the sheath 42 is retracted to allow the stent 20 to expand such as is shown in FIGs. 6 and 7.

In some embodiments, a grip 10 is at least partially constructed of a polymer material. In some embodiments the material has a Shore-A durometer value of about 60 to about 90 and in some embodiments about 70 to about 90. In some embodiments the grip is at least partially constructed from one or more materials such as: polyether ester; HYTREL (polyether-ester copolymer) by Du Pont Co.; polyether block amides; ARNITEL (polyether-ester copolymer) by DSM Engineering Plastics; PELLETHANE (polyurethane with polyester, polyether, or polycaprolactone copolymers) by Dow Chemical; polyurethane; aromatic polyether based polyurethanes, such as TECOTHANE available from Thermedics Inc.; silicon, rubber, or foam, etc.

In at least one embodiment the grip 10 is at least partially constructed from a radiopaque polymer or other radiopaque material.

The above disclosure is intended to be illustrative and not exhaustive. This description will suggest many variations and alternatives to one of ordinary skill in this art. All these alternatives and variations are intended to be included within the scope of the claims where the term "comprising" means "including, but not limited to". Those familiar with the art may recognize other equivalents to the specific embodiments described herein which equivalents are also intended to be encompassed by the claims.

Further, the particular features presented in the dependent claims can be combined with each other in other manners within the scope of the invention such that the invention should be recognized as also specifically directed to other embodiments having any other possible combination of the features of the dependent claims. For instance, for purposes of claim publication, any dependent claim which follows should be taken as alternatively written in a multiple dependent form from all prior claims which possess all antecedents referenced in such dependent claim if such multiple dependent format is an accepted format within the jurisdiction (e.g. each claim depending directly from claim 1 should be alternatively taken as depending from all previous claims). In jurisdictions where multiple dependent claim formats are restricted,

the following dependent claims should each be also taken as alternatively written in each singly dependent claim format which creates a dependency from a prior antecedent-possessing claim other than the specific claim listed in such dependent claim below.

- 5 This completes the description of the preferred and alternate embodiments of the invention. Those skilled in the art may recognize other equivalents to the specific embodiment described herein which equivalents are intended to be encompassed by the claims attached hereto.
